Thank you for buying this RESOL product. Please read this manual carefully to get the best performance from this unit. Please keep this manual safe.
Target group

These instructions are exclusively addressed to authorised skilled personnel. Only qualified electricians should carry out electrical works. Initial installation must be effected by the system owner or qualified personnel named by the system owner.

Description of symbols

**WARNING!** Warnings are indicated with a warning triangle! They contain information on how to avoid the danger described.

Signal words describe the danger that may occur, when it is not avoided.

- **WARNING** means that injury, possibly life-threatening injury, can occur.
- **ATTENTION** means that damage to the appliance can occur.

**Note**

Notes are indicated with an information symbol.

- Arrows indicate instruction steps that should be carried out.

Disposal

- Dispose of the packaging in an environmentally sound manner.
- Dispose of old appliances in an environmentally sound manner. Upon request we will take back your old appliances bought from us and guarantee an environmentally sound disposal of the devices.

Safety advice

Please pay attention to the following safety advice in order to avoid danger and damage to people and property.

Instructions

Attention must be paid to the valid local standards, regulations and directives!

Information about the product

Proper usage

The solar controller is designed for electronically controlling standard solar thermal systems in compliance with the technical data specified in this manual. Improper use excludes all liability claims.

**CE Declaration of conformity**

The product complies with the relevant directives and is therefore labelled with the CE mark. The Declaration of Conformity is available upon request, please contact the manufacturer.

**Note**

Strong electromagnetic fields can impair the function of the controller.

- Make sure the controller as well as the system are not exposed to strong electromagnetic fields.

Subject to technical change. Errors excepted.
The DeltaSol® AL is a temperature differential controller that offers all the vital functions for a standard solar thermal system. The controller is equipped with the comprehensive System-Monitoring-Display, which shows the system parameters quickly and easily.

For data communication, the controller is equipped with the RESOL VBus®. Operation and function control are straightforward.

1 Overview

- System-Monitoring-Display
- Up to 3 Pt1000 temperature sensors
- Heat quantity measurement
- Function control
- Solar operating hours counter
- Intuitive operating concept
- Unit °F and °C selectable

Technical data

Inputs: 3 Pt1000 temperature sensors
Outputs: 1 electromechanical relay (changeover)
Switching capacity: 4 (1) A 240 V~ (electromechanical relay)
Total switching capacity: 4 A 240 V~
Power supply: 100...240 V~ (50...60 Hz)
Supply connection: type Y attachment
Power consumption: < 0.7 W (Standby)
Mode of operation: type 1.B action
Rated impulse voltage: 2.5 kV
Data interface: RESOL VBus®
VBus® current supply: 35 mA
Functions: function control, operating hours counter, tube collector function and heat quantity measurement
Housing: plastic, PC-ABS and PMMA
Mounting: wall mounting, also suitable for mounting into patch panels
Indication/Display: System-Monitoring-Display for visualisation, 16-segment display, 7-segment display, 8 symbols for system states, background illumination and operating control LED
Operation: 3 push buttons and 1 slide switch
Protection type: IP 20/DIN EN 60529
Protection class: II
Ambient temperature: 0...40 °C [32...104 °F]
Degree of pollution: 2
Dimensions: 144 x 208 x 43 mm
2 Installation

2.1 Mounting

**WARNING! Electric shock!**
Upon opening the housing, live parts are exposed!

> Always disconnect the device from power supply before opening the housing!

**Note**
Strong electromagnetic fields can impair the function of the device.

> Make sure the device as well as the system are not exposed to strong electromagnetic fields.

The device must only be located in dry interior rooms.

The controller must additionally be supplied from a double pole switch with contact gap of at least 3 mm.

Please pay attention to separate routing of sensor cables and mains cables.

> Unscrew the crosshead screw from the cover and remove the cover.
> Mark the upper fastening point on the wall. Drill and fasten the enclosed wall plug and screw leaving the head protruding.
> Hang the housing from the upper fastening point and mark the lower fastening points (centres 180 mm).
> Drill and insert the lower wall plug.
> Fasten the housing to the wall with the lower fastening screw and tighten.
> Carry out the electrical wiring in accordance with the terminal allocation (see page 6).
> Put the cover on the housing.
> Attach with the fastening screws.

**System** DeltaSol® AL

Standard solar system

Electrical connection see page 6
### 2.2 Electrical connection

**WARNING!** Electric shock!
Upon opening the housing, live parts are exposed!
> Always disconnect the device from power supply before opening the housing!

**ATTENTION!** ESD damage!
Electrostatic discharge can lead to damage to electronic components!
> Take care to discharge properly before touching the inside of the device! To do so, touch a grounded surface such as a radiator or tap!

**Note**
Connecting the device to the power supply must always be the last step of the installation!

**Note**
It must be possible to disconnect the device from the mains at any time.
> Install the mains plug such that it is accessible at any time.
> If this is not possible, install a switch that can be accessed.

**Do not use the device if it is visibly damaged!**
Attach flexible cables to the housing with the enclosed strain relief and the corresponding screws.
The controller is supplied with power via a mains cable. The power supply of the device must be 100 ... 240 V~ (50 ... 60 Hz).

The controller is equipped with 1 changeover relay to which a load such as a pump, a valve, etc. can be connected.

- 10 Grounding terminal ±
- 11 Grounding terminal ±
- 12 Conductor R1-R (normally closed contact)
- 13 Conductor R1-A (normally open contact)
- 14 Neutral conductor N

Depending on the product version, mains cables and sensor cables are already connected to the device. If that is not the case, please proceed as follows:
Connect the temperature sensors (S1 to S3) to the following terminals with either polarity:

- 1/2 Sensor 1 (e.g. sensor collector)
- 3/4 Sensor 2 (e.g. sensor store)
- 5/6 Sensor 3 (e.g. sensor store top)

Connect the RESOL VBus® to the terminals marked VBus with either polarity:

- 7 VBus terminal
- 8 VBus terminal

The mains connection is at the following terminals:

- 15 Neutral conductor N
- 16 Conductor L
- 9 Grounding terminal ±
2.3 Data communication/Bus

The controller is equipped with the RESOL VBus\textsuperscript{®} for data transfer and energy supply to external modules. The connection is to be carried out at the two terminals marked VBus (any polarity). One or more RESOL VBus\textsuperscript{®} modules can be connected via this data bus, such as:

- RESOL GA3 Large display module
- RESOL SD 3 Smart Display
- RESOL DL2 Datalogger

Furthermore, the controller can be connected to a PC or integrated into a network via the RESOL VBus\textsuperscript{®}/USB or VBus\textsuperscript{®}/LAN interface adapter (not included).

\textbf{Note}

More accessories on page 19.

2.4 Terminal allocation

Standard solar thermal system with 1 store, 1 pump and 2 or 3 sensors. The sensors S1/S2 can also be used for heat quantity measurement.

3 Operation and function

3.1 Buttons

The controller is operated via the 3 buttons next to the display:

Button ↑: Scrolling upwards, increasing adjustment values
Button ✓: SET Confirmation / selection
Button ↓: Scrolling downwards, reducing adjustment values

During normal operation, display channels will be displayed.

→ In order to scroll between display channels, press buttons ↑ and ↓.

Access to adjustment channels

→ Use button ↓ in order to scroll to the last display channel, then press and hold down button ↓ for approx. 3 s.

If an adjustment channel is shown on the screen, SET will be displayed on the right-hand side next to the channel name.

→ Press button ✓ in order to select an adjustment channel.

SET starts flashing.
→ Adjust the desired value with buttons ↑ and ↓.
→ Briefly press button ✓.

SET permanently appears, the adjusted value has been saved.

3.2 System-Monitoring-Display

The System-Monitoring-Display consists of 3 blocks: channel display, tool bar and system screen.

3.2.1 Channel display

The channel display consists of 2 lines. The upper display line is an alphanumeric 16-segment display. In this line, mainly channel names and menu items are displayed. In the lower 7-segment display, values and parameters are displayed.

3.2.2 Tool bar

The additional symbols in the tool bar indicate the current system state.

</tbody>
</table>
3.2.3 System screen

The system scheme is indicated on the System-Monitoring-Display. It consists of several system component symbols which are – depending on the current status of the system – either flashing or permanently shown.

![System screen diagram]

Collector
with collector sensor

Temperature sensor

Store
with heat exchanger

Pump

3.3 Slide switch

By means of the slide switch the relay can be manually switched on (I), switched off (0) or put into automatic mode (Auto).

- Manually Off = 0 (left)
- Manually On = I (right)
- Automatic = Auto (centre)

3.4 Flashing codes

3.4.1 System screen flashing codes

- Pump symbol is flashing when the relay is active.
- Sensor symbols are flashing if the corresponding sensor display channel is selected.
- Sensors symbols are flashing quickly in the case of a sensor fault.

3.4.2 LED flashing codes

- Green: everything OK
- Red/green flashing: initialisation phase
- Red flashing: manual mode
- Red flashing: sensor fault
  (sensor symbol is flashing quickly)
### Control parameters and display channels

Operating hours counter

h P
Operating hours counter
Display channel
The operating hours counter accumulates the operating hours (h P) of the relay. Full hours are displayed.
The accumulated operating hours can be set back to zero. As soon as the operating hours channel is selected, the symbol SET is displayed.
➢ In order to access the reset mode of the counter, press button ✓ for approx. 2 s. SET starts flashing and the operating hours will be set back to zero.
➢ In order to finish the reset, press button ✓.
In order to interrupt the reset process, do not press any button for about 5 s. The display returns to the display mode.

Display of heat quantity

kW h
Heat quantity in kW h/MW h
Display channel
Indicates the heat quantity produced in the system. It is shown in kW h in the kWh channel and in MW h in the MWh channel. The overall heat quantity results from the sum of both values.
The accumulated heat quantity can be set back to zero. As soon as one of the display channels of the heat quantity is selected, the symbol SET is displayed.
➢ In order to access the reset mode of the counter, press button ✓ for approx. 2 s. SET starts flashing and the heat quantity value will be set back to zero.
➢ In order to finish the reset, press button ✓.
In order to interrupt the reset process, do not press any button for about 5 s. The display returns to the display mode.

4.3 Adjustment channels

Access to adjustment channels:
➢ Use button ↓ in order to scroll to the last display channel, then press and hold down button ↓ for approx. 3 s.

ΔT control

DT O
Switch-on temperature difference
Adjustment range: 1.0 ... 20.0 K [2.0 ... 40.0 °Ra]
Factory setting: 6.0 K [12.0 °Ra]

DT F
Switch-off temperature difference
Adjustment range: 0.5 ... 19.5 K [1.0 ... 39.0 °Ra]
Factory setting: 4.0 K [8.0 °Ra]

Note
The switch-on temperature difference must be at least 0.5 K [1.0 °Ra] higher than the switch-off temperature difference.
The controller works as a standard differential controller. If the temperature reaches or exceeds the switch-on temperature difference, the pump switches on. When the temperature difference reaches or falls below the adjusted switch-off temperature difference, the respective relay switches off.
Maximum store temperature

S MX
Maximum store temperature
Adjustment range: 4 ... 95 °C [40 ... 200 °F]
Factory setting: 60 °C [140 °F]
Hysteresis 2 K [4 °Ra]
If the store temperature reaches the adjusted maximum temperature, the store will no longer be loaded in order to avoid damage caused by overheating. A non-adjustable hysteresis of 2 K [4 °Ra] is set for the maximum store temperature. If the maximum store temperature is exceeded, ☀ is displayed. Sensor S2 is used as the reference sensor.

Note
If the collector cooling function is activated, the store temperature may exceed the adjusted maximum value. In order to prevent system damage, the controller is also equipped with an integrated store emergency shutdown, deactivating the system if the store reaches 95 °C [200 °F].

Collector cooling

OCX
Collector cooling option
Selection: OFF / ON
Factory setting: OFF
CMX
Collector maximum temperature
Adjustment range: 100 ... 190 °C [210 ... 380 °F]
Factory setting: 120 °C [250 °F]
Hysteresis: 5 K [10 °Ra]
The collector cooling function keeps the collector temperature within the operating range by heating the store. If the store temperature reaches 95 °C [200 °F] the function will switch off for safety reasons. If the store temperature exceeds the adjusted maximum store temperature, the solar system is switched off. If the collector temperature increases to the adjusted maximum collector temperature, the solar pump is activated until the collector temperature falls below the maximum collector temperature. The store temperature may then exceed the maximum temperature, but only up to 95 °C [200 °F] (emergency shutdown of the store).

If the OREC option is additionally activated:
If the store temperature is higher than the maximum store temperature (S MX) and if the collector temperature is at least 5 K [10 °Ra] below the store temperature, the solar system remains active until the store is cooled down below the adjusted maximum store temperature (S MX) via the collector and the pipework. If the collector cooling function is active, ☀ is displayed (flashing). Due to the combined cooling functions, the system will have a longer operation time on days with excess solar irradiation and guarantees thermal relief of the collector field and the heat transfer fluid.

Collector emergency temperature

EM
Collector emergency temperature
Adjustment range: 110 ... 200 °C [230 ... 400 °F]
Factory setting: 140 °C [280 °F]
Hysteresis: 10 K [20 °Ra]
If the collector temperature exceeds the adjusted collector emergency temperature (EM), the solar pump is switched off in order to protect the system components against overheating.
If the maximum collector temperature is exceeded, △ is displayed (flashing).
**Minimum collector limitation**

**OCN**
Collector minimum limitation option  
Selection: O FF / O N  
Factory setting: O FF

If the collector minimum limitation option is activated, the pump (R1) is only switched on if the adjustable collector minimum temperature is exceeded. The minimum temperature prevents the pump from being switched on too often at low collector temperatures. A non-adjustable hysteresis of 5 K [10 °Ra] is set for this function. If the collector minimum limitation is active, ❄ is displayed (flashing).

**Antifreeze function**

**OCF**
Antifreeze option  
Selection: O FF / O N  
Factory setting: O FF

The antifreeze function activates the loading circuit between the collector and the store when the temperature falls below the adjusted antifreeze temperature. This will protect the fluid against freezing or coagulating. If the adjusted antifreeze temperature is exceeded by 1 K [2 °Ra], the loading circuit will be deactivated. If the antifreeze function is activated, ❄ is displayed. If the antifreeze function is active, Ⓞ and ❄ are displayed (flashing).

**Note**
Since this function uses the limited heat quantity of the store, the antifreeze function should be used in regions with few days of temperatures around the freezing point.

**CMN**
Minimum collector temperature  
Adjustment range: 10 ... 90 °C  
[50 ... 200 °F]  
Factory setting: 10 °C [50 °F]

**Recooling function**

**OREC**
Recooling option  
Selection: O FF / O N  
Factory setting: O FF

If the store temperature reaches the adjusted maximum store temperature (S MX), the controller keeps the solar pump running in order to prevent the collector from being overheated. The store temperature may increase, but only up to 95°C [200 °F] (emergency shutdown of the store).

If the store temperature is higher than the maximum store temperature (S MX) and if the collector temperature is lower than the store temperature, the solar system remains active until the store is cooled down below the adjusted maximum store temperature (S MX) via the collector and the pipework.

**Note**
Only use the recooling function if the collector cooling function is activated.

**CFR**
Antifreeze temperature  
Adjustment range: -10 ... +10 °C  
[10 ... 50 °F]  
Factory setting: 4.0 °C [40 °F]
Tube collector function

OTC
Tube collector function
Adjustment range: OFF / ON
Factory setting: OFF
This function is used for improving the switch-on behaviour in systems with non-ideal sensor positions (e.g. with some tube collectors).
If the controller detects an increase in collector temperature by 2 K [4 °Ra] compared to the previously stored collector temperature, the solar pump will be switched-on for about 30 s in order to detect the fluid temperature. The current collector temperature will then be saved as a new reference value. If the measured temperature (new reference value) is exceeded by 2 K [4 °Ra], the solar pump will again run for 30 s.
If the switch-on difference between the collector and the store is exceeded during the runtime of the solar pump, the controller will automatically switch to solar loading.
If the collector temperature decreases by 2 K [4 °Ra] during a loading break, the switch-on value for the tube collector function will be recalculated.

Heat quantity measurement

FMAX
Flow rate in l/min
Adjustment range: 0 ... 20
in steps of 0.1
Factory setting: 6.0

MEDT
Heat transfer fluid
Adjustment range: 0 ... 3
Factory setting: 1
Heat transfer fluid:
0 : Water
1 : Propylene glycol
2 : Ethylene glycol
3 : Tyfocor® LS/G-LS

MED%
Antifreeze concentration in (vol-)%
(MED% will not be displayed when MEDT 0 or 3 is used)
Adjustment range: 20 ... 70
Factory setting: 45

Information on the flow rate, the values of the reference sensors flow and store as well as on the heat transfer fluid are used for calculating the heat quantity supplied.
Heat quantity measurement is possible if a flowmeter is used.
⇒ Read the flow rate (l/min) and adjust it in the FMAX channel.
⇒ Adjust the antifreeze type and concentration of the heat transfer fluid in the channels MEDT and MED%.
Temperature unit

UNIT
Temperature unit
Selection: °C / °F
Factory setting: °C

In this adjustment channel, the display unit for temperatures and temperature differences can be chosen. The unit can be switched between °C / K and °F / °Ra during operation.

Temperatures and temperature differences in °F and °Ra are displayed without units. If the indication is set to °C, the units are displayed with the values.

Language

LANG
Language selection
Selection: dE, En, It, Fr
Factory setting: dE

In this adjustment channel the menu language can be selected.
• dE : German
• EN : English
• It : Italian
• Fr : French
5 Troubleshooting

WARNING! Electric shock!
Upon opening the housing, live parts are exposed!
⇒ Always disconnect the device from power supply before opening the housing!

The controller is protected by a fuse. The fuse holder (which also holds the spare fuse) becomes accessible when the cover is removed. To replace the fuse, pull the fuse holder from the base.

If a malfunction occurs, the display symbols will indicate an error code (see page 8).

Sensor fault. An error code instead of a temperature is shown on the sensor display channel.

Cable is broken. Check the cable.

Short circuit. Check the cable.

Disconnected temperature sensors can be checked with an ohmmeter. Please check if the resistance values correspond with the table.

Resistance values of Pt1000 sensors

Note
For answers to frequently asked questions (FAQ) see www.resol.com.
Operating control LED is permanently off.

If the operating control LED is off, check the power supply of the controller. Is it disconnected?

- no
- yes

The fuse of the controller could be blown. The fuse becomes accessible when the cover is removed. The fuse can then be replaced.

Check the supply line and reconnect it.

Pump is overheated, but no heat transfer from the collector to the store, flow and return have the same temperature; perhaps also bubbling in the lines.

- no
- yes

Air or gas bubbles in the system?

Is the collector circuit blocked at the dirt trap?

- yes
- no

Clean dirt trap

Pump starts up very late.

Switch-on temperature difference $\Delta T_{\text{on}}$ too large?

- no
- yes

- Change $\Delta T_{\text{on}}$ and $\Delta T_{\text{off}}$ correspondingly.

Non-ideal position of the collector sensor (e.g. flatscrew sensor instead of sensor in immersion sleeves).

- yes
- no

Activate tube collector function if necessary.

The temperature difference between store and collector increases enormously during operation; the collector circuit cannot dissipate the heat.

Collector circuit pump defective?

- yes
- no

- Check/replace it

Heat exchanger calcified?

- yes
- no

Decalify it

Heat exchanger blocked?

- yes
- no

Clean it

Heat exchanger too small?

- yes
- no

Replace with correctly sized one.

Temperature difference at the controller too small?

- yes
- no

Wrong position of collector sensors?

- yes
- no

Mount the collector sensor at solar flow (warmest collector output); use immersion sleeve of the respective collector.

Plausibility control of the option tube collector special function

- yes
- no

O.k.

Change $\Delta T_{\text{on}}$ and $\Delta T_{\text{off}}$ correspondingly.
The solar circuit pump does not work, although the collector is considerably warmer than the store

Is the operating control LED on?
- yes
- no

Does the pump start up in manual operation?
- no
- yes

Is the pump current enabled by the controller?
- yes
- no

Is the fuse of the controller OK?
- yes
- no

Is the pump stuck?
- yes
- no

Turn the pump shaft using a screwdriver; now passable?
- no
- yes

Pump is defective - replace it.

Controller might be defective - replace it.

Store cools down at night.

Collector circuit pump runs during the night?
- no
- yes

Collector temperature at night is higher than the outdoor temperature.
- no
- yes

Sufficient store insulation?
- yes
- no

Increase insulation.

Insulation close enough to the store?
- yes
- no

Replace insulation or increase it.

Are the store connections insulated?
- yes
- no

Insulate the connections.

Warm water outflow upwards?
- no
- yes

Change connection and let the water flow sidewards or through a siphon (downwards); less store losses now?
- no
- yes

Use the circulation pump with timer and switch-off thermostat (energy-efficient circulation).

Does the DHW circulation run for a very long time?
- no
- yes

Circulation pump and blocking valve should be switched off for 1 night; less store losses?
- yes
- no

Check whether the pumps of the after-heating circuit run at night; check whether the non-return valve is defective; problem solved?
- no

Check the non-return valve in warm water circulation - o.k.
- yes
- no

The gravitation circulation in the circulation line is too strong; insert a stronger valve in the non-return valve or an electrical 2-port valve behind the circulation pump; the 2-port valve is open when the pump is activated, otherwise it is closed;

Further pumps which are connected to the solar store must also be checked.

Clean or replace it.

Connect pump and 2-port valve electrically in parallel; activate the circulation again. Deactivate pump speed control!
6 Accessories

6.1 Sensors

Sensors
The product range includes high-precision platinum temperature sensors, flatscrew sensors, outdoor temperature sensors, indoor temperature sensors, cylindrical clip-on sensors, also as complete sensors with immersion sleeve.

Overvoltage protection device
In order to avoid overvoltage damage at collector sensors (e.g. caused by local lightning storms), we recommend installing the overvoltage protection RESOL SP10.

6.2 VBus® accessories

SD3 Smart Display/GA3 Large Display
The remote displays are used for visualising data issued by the controller: collector temperature, store temperature and energy yield of the solar thermal system. The use of high-efficiency LEDs and filter glass assures a high optical brilliance and good readability even in poor visibility conditions and from a larger distance. Both remote displays are connected to the controller by means of the RESOL VBus®.

AM1 Alarm module
The AM1 Alarm Module is designed to signal system failures. It is to be connected to the VBus® of the controller and issues an optical signal via the red LED if a failure has occurred. The AM1 also has a relay output, which can e.g. be connected to a building management system (BMS). Thus, a collective error message can be issued in the case of a system failure.

VBus®/LAN interface adapter
The VBus®/LAN interface adapter is designed for the direct connection of the controller to a PC or router. It enables easy access to the controller via the local network of the owner. Thus, controller access and data charting can be effected from every workstation of the network. The VBus®/LAN interface adapter is suitable for all controllers equipped with a RESOL VBus®. The RESOL ServiceCenter software is included.

DL2 Datalogger
This additional module enables the acquisition and storage of large amounts of data (such as measuring and balance values of the solar system) over a long period of time. The DL2 can be configured and read-out with a standard Internet browser via its integrated web interface. For transmission of the data stored in the internal memory of the DL2 to a PC, an SD card can be used. The DL2 is appropriate for all controllers with RESOL VBus®. It can be connected directly to a PC or router for remote access and thus enables comfortable system monitoring for yield monitoring or for diagnostics of faults.
Important note
The texts and drawings in this manual are correct to the best of our knowledge. As faults can never be excluded, please note:
Your own calculations and plans, under consideration of the current standards and directions should only be basis for your projects. We do not offer a guarantee for the completeness of the drawings and texts of this manual - they only represent some examples. They can only be used at your own risk. No liability is assumed for incorrect, incomplete or false information and / or the resulting damages.

Note
The design and the specifications can be changed without notice.
The illustrations may differ from the original product.
